James Sharma SP AE1 Report

As far as I know, date.c and tldlist.c compile and link together without warnings, and work correctly when tested with small.txt and large.txt, compared to the .out data. It works on both my home PC as well as on the university server.

According to the clang address sanitiser there's no leaks, and there's no undefined behaviour identified by the undefined sanitiser.

There may be uninitialized reads to memory, but I don't know because I wasn't able to get the clang memory sanitiser command working. It said there was an issue with the shadow memory using a non-PIE build.
